

CAS BACnet Wireshark Report Tool – A Free Utility for Automation Professionals

Chipkin Automation Systems Inc. has developed the CAS BACnet Wireshark Report Tool to help automation professionals to quickly locate intermittent issues and errors within a large Wireshark log with BACnet traffic.

Vancouver, BC – The new CAS BACnet Wireshark Report Tool has been released by Chipkin Automation Systems Inc. on September 1st, 2018. This release provides a valuable support for any BACnet system that uses Wireshark. Automation professionals can download the program for free and without having to register, or provide an email address. The software runs without limitations and without annoying delays or advertisements.

Wireshark is a free and open source packet analyzer. It is used for network troubleshooting, analysis, software and communications protocol development, and education. Wireshark is cross-platform, using the Qt widget toolkit in current releases to implement its user interface, and using pcap to capture packets; it runs on Linux, macOS, BSD, Solaris, some other Unix-like operating systems, and Microsoft Windows.

The CAS BACnet Wireshark Report Tool only requires 2 MB of free hard drive space. It can be downloaded here with zero commitment:
