Gateway for the integration of Modbus RTU slave devices into BACnet/IP control systems.

Models available for this gateway, with their following Order codes:

**IBOX-BAC-MBRTU-100**
Tiny model supporting connection to up to 254 Modbus slave devices and 110 internal datapoints.

**IBOX-BAC-MBRTU-A**
Basic model supporting connection to up to 254 Modbus slave devices and 500 internal datapoints.

**IBOX-BAC-MBRTU-B**
Extended model supporting connection to up to 254 Modbus slave devices and 3000 internal datapoints.

1. Description

1.1 Introduction

This document describes the integration of Modbus RTU Master systems with BACnet ASHRAE 135 – 2001 Annex J - BACnet protocol compatible devices or systems using the gateway IntesisBox BACnet/IP Server - Modbus RTU Master.

This document assumes that the user is familiar with Modbus and BACnet/IP technology and technical terms.

From now on, and with the aim of easy the read of this document, the words “gateway” or “IntesisBox” are used instead of IntesisBox BACnet/IP Server - Modbus RTU Master. Any other use of the word "gateway" not meaning IntesisBox BACnet/IP Server - Modbus RTU Master will be specifically indicated.

The aim of this integration is to make accessible Modbus system signals and resources from a BACnet/IP based control system or device, as if it was a part of the own BACnet system and vice-versa. For this, the gateway acts as a BACnet/IP Server device in its BACnet interface, allowing other BACnet/IP devices to perform subscription (COV) requests, and also read and write its internal points. From the Modbus system point of view, IntesisBox simulates a Modbus master device, the readings of the Modbus slave device(s) is performed by IntesisBox by automatic continuous polling.

![Diagram of integration of Modbus and BACnet/IP using IntesisBox BACnet/IP Server - Modbus RTU Master gateway](image)

**Figure 1.1** Integration of Modbus and BACnet/IP using *IntesisBox BACnet/IP Server - Modbus RTU Master* gateway
1.2 Functionality

The integration operation is as follow:

From the Modbus system point of view, after the start up process, IntesisBox reads continuously the points configured to be read in the Modbus slave devices, and updates in its memory all the values received from the Modbus system.

From the BACnet system point of view, after the start up process, the gateway listen for any subscription (COV) request, serves any polling request, or performs any writing request of its internal points received from BACnet system. The values received from BACnet are immediately written in the associated register of the corresponding Modbus slave device.

Every one of the Modbus registers in the slave devices is associated to a BACnet object, with this, all the Modbus system (all the slave devices) is seen as a single BACnet device with many objects from the BACnet system point of view, each object corresponding to a Modbus slave/register address.

When a new value is read from Modbus for a given register, the new value is updated in the gateway's memory and, if this signal is associated to a BACnet active subscription then the new value will be sent to the subscripted BACnet device(s).

In the continuous polling of the Modbus devices, if a non response of the Modbus device is detected, the corresponding virtual signal inside IntesisBox will be activated indicating communication error with the Modbus device. These virtual signals indicating communication status in real time with the Modbus devices are also accessible from BACnet, like the rest of the points of IntesisBox.

There are different models of IntesisBox BACnet/IP Server - Modbus RTU Master, with different capacity every one of them.

- Tiny model supporting connection to up to 110 internal data points.  
  *Ref.: IBOX-BAC-MBRTU-100.*

- Basic model supporting connection to up to 500 internal data points.  
  *Ref.: IBOX-BAC-MBRTU-A.*

- Extended model supporting connection to up to 3000 internal data points.  
  *Ref.: IBOX-BAC-MBRTU-B.*
2. Interfaces

This section gives the reader an idea on how a Modbus system/installation is integrated with IntesisBox BACnet. It is not meant to provide an in-depth explanation on how BACnet or Modbus technology work as understanding the protocol principles is assumed throughout this document.

The IntesisBox behaves as a regular BACnet device inside the BACnet system integrating all the KNX devices. Note that each datapoint defined on IntesisBox will have two associated data types:

- One data-type, related to the BACnet/IP protocol of the IntesisBox
- And another data-type, related to Modbus side of IntesisBox

Conversions of data values from Modbus to BACnet/IP data-types (and vice versa) are internally performed at application level of IntesisBox, and keeping the highest possible level of precision, with the restrictions of the data-type itself. Further detail on behavior and data-types of the BACnet/IP and Modbus interfaces of IntesisBox is given in the following sections.

All configuration of IntesisBox BACnet is done using software tool LinkBoxBacnet. This tool, covered in depth in section 5, is used to define the Modbus and BACnet related parameters on each of the datapoints defined in IntesisBox.

2.1 BACnet

The IntesisBox integrates all the Modbus devices in a single BACnet device. The communication with the other BACnet devices is done via the Ethernet port of the gateway which implements the BACnet ASHRAE 135 – 2001 Annex J - BACnet protocol.

The supported BACnet Objects and Building Blocks can be found in the PICS document available on the web:

http://www.intesis.com/pdf/IntesisBox_BACnet_IP_Server_Modbus_RTU_master_PICS.pdf

Configuration of all BACnet/IP parameters of IntesisBox and their links to Modbus using LinkBoxBacnet software tool is covered in section 5.1.

2.2 Modbus

Modbus RTU communication is characterised by the co-existence of just one master and one or more slave devices in a given network, all of them interconnected, and every slave with a unique address into the network. Different types of networks and network topologies are allowed. The more commonly used for Modbus RTU communication are: point to point communication using RS232, and point to multipoint communication using RS485 (2-wire or 4-wire).

IntesisBox acts as the master in the Modbus network, and the other Modbus devices connected to the network must be always slave devices. Up to 254 slave devices can be defined in IntesisBox. The types of networks supported by IntesisBox are:

- RS485 2-wire (up to 254 slave devices are allowed by IntesisBox, thus up to 254 slave devices in the same RS485 network can be integrated with just one IntesisBox, installing additional line repeaters where necessary).
• RS232 (for single slave integration).

Modbus slave devices are normally characterised by their communication parameters (baud rate, data bits, parity), some of them sometimes configurable depending on the device, and their predefined registers address map, this address map specifies the address, type and characteristics of every internal point (commonly called register) of the Modbus slave device, these registers being accessible using Modbus RTU protocol.

Communication parameters of IntesisBox’s Modbus interface (baud rate, data bits, stop bits, parity) are fully configurable to adapt to any slave device. Of course IntesisBox and all the slave devices connected to the Modbus network must use the same communication parameters.

Modbus RTU protocol defines different types of function codes to use to read/write different type of registers that can be found in Modbus devices, and also different data formats to encode values. All these are explained in section 5.1.2

Also the data encoding used for 16 bits registers (big-endian or little-endian) can be configured in IntesisBox’s Modbus interface. This is the byte order for data encoding (MSB..LSB or LSB..MSB). This data encoding, although is specified as big-endian in Modbus protocol specification, it varies depending on manufacturer/type of slave device.

All this gives great flexibility to integrate a wide range of Modbus slave devices that can be found in the market.
3. Quick Setup

1. Install LinkBoxBacnet. Details in section 5

2. Install IntesisBox in the desired installation site (DIN rail mounting inside a metallic industrial cabinet connected to ground is recommended).

3. Power up and connect the communication cables. Details in section 4.

4. Open LinkBoxBacnet, open a project or create a new one. Details in section 5.

5. Connect to the IntesisBox (details in section 5).

6. (optional) Configure the IntesisBox. Details in section 5.1.

7. Check if there is communication in both BACnet and Modbus buses (section 5)

8. The IntesisBox is ready to be used in your system.
4. Connection

The device uses a standard enclosure allowing DIN EN60715 TH35 rail mounting. Its plastic meets standard PC UL 94 V0.

![Device connection diagram](image)

**Figure 4.1 Device connection diagram**

Ensure proper space for all connectors when mounted.

The items supplied by Intesis Software for this integration are:

- IntesisBox BACnet/IP Server - Modbus RTU Master hardware
- Console cable. Standard DB9F-DB9M cable 1.8 meter long.
- Installation sheet, containing a link to the LinkBoxBacnet software and this manual.

### 4.1 Power device

The first step to perform is to power up the device. To do so a power supply working with any of the voltage range allowed is needed (check section 6). Once connected the ON led (Figure 4.1) will turn on.

**WARNING!** In order to avoid earth loops that can damage the gateway and/or any other equipment connected to it, we strongly recommend:
The use of DC power supplies, floating or with the negative terminal connected to earth. **Never use a DC power supply with the positive terminal connected to earth.**

The use of AC power supplies only if they are floating and not powering any other device.

### 4.2 Connect to Modbus

Connect the communication cable coming from the Modbus network to the port marked as Modbus of IntesisBox (Figure 4.1). Two methods to connect to the Modbus network can be used:

- The RS485 port if the network is RS485 2-wire. Connect the + and the – to the respective ports in the slave devices (polarity matters)

- The RS232 port if the connection is point to point to one single slave.

</tr>
</tbody>
</table>

Table 4.1 Modbus RS232 cable pinout

How to check if there is communication with the Modbus bus is explained in the LinkBoxBacnet Manual (section 5).

### 4.3 Connect to BACnet

Connect the communication cable coming from the network hub or switch to the ETH port (Figure 4.1) of IntesisBox. The cable to be used depends on where the IntesisBox is being connected:

- Connecting directly to a BACnet/IP device: crossover Ethernet UTP/FTP CAT5 cable

- Connecting to a hub or switch of the LAN of the building: a straight Ethernet UTP/FTP CAT5 cable

In case there is no response from the BACnet devices to the frames sent by IntesisBox, check that they are operative and reachable from the network connection used by IntesisBox. Check the IntesisBox Ethernet interface sending Pings to its IP address using a PC connected to the same Ethernet network.

### 4.4 Connect to PC (LinkBoxBacnet)

This action allows the user to have access to configuration and monitoring of the device (more information can be found in the LinkBoxBacnet User Manual [section 5]). Two methods to connect to the PC can be used:

---

¹ Check your Modbus device's user's manual provided by its respective manufacturer to know more details about pinout.
- Ethernet: Using the ETH port (Figure 4.1) of IntesisBox. How to check connectivity is explained in section 4.3.

- Serial cable: To connect the device to the PC the serial cable supplied should be plugged to the PC console port (Figure 4.1). The cable is a RS-232 straight cable and its pinout is at explained in Table 4.2.

<table>

5. LinkBoxBacnet. Configuration & monitoring of IntesisBox BACnet series

How to install and use the LinkBoxBacnet is explained in its Manual. It can be found in the installation folder (if the software is already installed) or it can be downloaded from the link that can be found in the installation sheet supplied with the IntesisBox.

In this section only the specific project configuration for IntesisBox BACnet/IP Server - Modbus RTU Master is going to be explained.

The External Protocol in this IntesisBox is Modbus

5.1 Project configuration

To configure the integration connection parameters, and the points list, click on Config in the Button Bar (Figure 5.1). The Modbus Configuration window will be opened. For integrations with a large number of points an alternative CSV based configuration method is explained in the LinkBoxBacnet Manual.

![Figure 5.1 Menu and Button Bar in LinkBoxBacnet](image)

5.1.1 Connection configuration

Two subsets of information are configured using this window, the BACnet/IP parameters of the IntesisBox, and the parameters of the Modbus interface.
Figure 5.2 Configuration: Connection Tab

BACnet/IP interface configuration parameters:

- **IP**: Enter the IP address for the gateway (supplied by the network administrator).
- **NetMask**: Enter the IP NetMask for the gateway (supplied by the network administrator).
- **Gateway**: Enter the Default Gateway address (router address) in case the gateway (IntesisBox) is in a different sub network than other BACnet devices (supplied by the network administrator). Leave blank if there is no need of router address.
- **BACnet Port**: Enter the BACnet port number used by the gateway (by default 47808, which is BACO).
- **Device**: Enter the BACnet device number for the gateway (must be unique inside the BACnet system).

- **Device Name**: Select the BACnet device name for the gateway (by default "Modbus Gateway"). This name will be collected by BACnet browsers among others.

- **Version**: Select the gateway model used: tiny, basic or extended. You can check the gateway model in the identification given by the device when it connects to LinkBoxBacnet, it appears in the IntesisBox Communication Console window once connected to the gateway:

  IntesisBox_Bacnet_Modbus-100… → Tiny model  
  IntesisBox_Bacnet_Modbus-A… → Basic model  
  IntesisBox_Bacnet_Modbus-B… → Extended model

- **Firmware version**: Select the gateway firmware version. If not done correctly the configuration is not going to work.

**Modbus interface configuration parameters:**

- **Connection**: Type of connection used (RS232 or RS485).

- **Baud Rate**: Baud rate used for the communication.

- **Data Bits**: Data bits used.

- **Parity**: Parity used.

- **Timeout polling**: Timeout (in milliseconds) between two consecutive polling cycles.

- **Timeout interframe**: Inter-frame timeout (in milliseconds), some devices need inter-frame delay to communicate properly. Increase this timeout if you experience communication problems with slaves.

- **Byte order** (Modbus endianism): Byte order for data fields inside Modbus telegrams (LSB..MSB or MSB..LSB). It will depend on the slaves, consult the slave.
documentation for details. If unknown just try the two possible choices and see if the read values make sense. This affects to all data fields of all slaves defined.

- **Devices**: List of Modbus slave devices to communicate to. Check the devices you want to activate. Select a device to configure its properties.

- **+/−**: Use this button to define the number of Modbus slave devices to communicate to (Up to 254 devices)

For every Modbus device defined, the following properties must be entered:

- **Name**: Enter the device name (optional, just for identification purposes).

- **Slave #**: Enter the slave number configured in the Modbus device.

5.1.2 Signals configuration

Select the Signals tab (Figure 5.5) to configure the signals list (the IntesisBox internal points). More information about the meaning of the columns can be found in the tables below.

Every row in the grid corresponds to a signal (point). Signals (rows in the grid) can be added or deleted selecting the desired row and clicking Add or Delete buttons. Multiple consecutive rows can be deleted too.

**Figure 5.5 Signal list**

| **Restrictions** | Only used with Format=11 (16 bits digital) and Code= 3 or 4 (read holding/input registers).
To decode more than one of the bits of the 16 bits register all the decoding rows should be grouped together in the table |
| **Edit mode** | Text edit |

<table>
<thead>
<tr>
<th><strong>Frac</strong></th>
</tr>
</thead>
</table>
| **Description** | Fractional part to consider for the point's value when read/write. Some devices encode for example temperature values (integer + fractional part) in common 2-bytes Modbus registers (using data format 16 bits signed two's complement for example); the problem of using 2-bytes registers is that no fractional part can be encoded.
To avoid this problem, the real value in the device is sent multiplied by 10 as just integer part (a real value of 25.1 will be sent as 251). For this kind of points for example you can specify a value of 1 in Frac column. Then the value decoded by IntesisBox from the slave will be divided by 10, and the value will be multiplied by 10 before writing to the slave, thus will be the real value in the device (including integer and fractional part). |

### 0 / 1 based register

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Some Modbus devices use 0-based register addresses (also referred as Jbus), while others use 1-based register addresses (also referred as Modbus), in the Modbus communication (for 1-based devices, the register address 100 is specified as 99 in the Modbus communication frames). Select 0-Based if your Modbus devices use 0-based address map (like PLCs), or select 1-Based if your Modbus devices use 1-based address map.</td>
</tr>
</tbody>
</table>
## How to configure read/write points

First of all is important to take into account that different names for Modbus function codes, are used in technical literature depending on the manufacturer of the Modbus device. The following table shows the equivalence between nomenclature for function codes, used by Intesis Software in IntesisBox and the used in Modbus protocol specification.

<table>
<thead>
<tr>
<th>Function code</th>
<th>IntesisBox</th>
<th>Modbus protocol specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Read digital outputs</td>
<td>Read Coils</td>
</tr>
<tr>
<td>02</td>
<td>Read digital inputs</td>
<td>Read Discrete Inputs</td>
</tr>
<tr>
<td>03</td>
<td>Read analog registers</td>
<td>Read Holding Registers</td>
</tr>
<tr>
<td>04</td>
<td>Read analog inputs</td>
<td>Read Input Registers</td>
</tr>
<tr>
<td>05</td>
<td>Write 1 digital output</td>
<td>Write Single Coil</td>
</tr>
<tr>
<td>06</td>
<td>Write 1 analog register</td>
<td>Write Single Register</td>
</tr>
<tr>
<td>15</td>
<td>Write multiple digital outputs</td>
<td>Write Multiple Coils</td>
</tr>
<tr>
<td>16</td>
<td>Write multiple analog registers</td>
<td>Write Multiple Registers</td>
</tr>
</tbody>
</table>

Given a point in a Modbus slave device, if this point allows to be read and written, different Modbus function codes must be used for read and for write actions (consult the slave documentation for details of what function codes must be used for read and for write). Use the following criteria for configuration of this kind of points in IntesisBox:

<table>
<thead>
<tr>
<th>Description</th>
<th>Buttons to move the selected row (or rows) up or down inside the grid. To move up or down inside the grid a single row or a group of consecutive rows, just select the row or rows using the left button of the mouse and push the desired up or down button.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>This can be done also using the key combinations ALT+arrow up or ALT+arrow down instead of up or down buttons.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Button that adds a row under the selected one.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Buttons to delete the selected row (or rows).</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Save the configuration (details in section 5.1.4)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Exits the configuration window (details in section 5.1.4)</th>
</tr>
</thead>
</table>
1. If the Modbus function code to use for read is 03 and the function code to use for write is 06 (which is very common), then select the function code 3-Read analog registers in column Modbus Code and select a BACnet Type Output or Value for the point (i.e. AO, AV, BO, BV, MO, MV). With this, IntesisBox will use function code 03 for read the point in every polling cycle, and whenever a new value for the point is received from BACnet, the new value will be written in the Modbus slave device using function code 06.

2. If the Modbus function code to use for read is 01 and the function code to use for write is 05 (which is also very common), then select the function code 1-Read digital outputs in column Modbus Code and select a BACnet Type Output or Value for the point (i.e. AO, AV, BO, BV, MO, MV). With this, IntesisBox will use function code 01 for read the point in every polling cycle, and whenever a new value for the point is received from BACnet, the new value will be written in the Modbus slave device using function code 05.

3. If the Modbus function code to use for read and the function code to use for write are different than 01-05 or 03-06 (sometimes found with specific devices), then you have to declare two points in IntesisBox to perform the read and the write separately. The way to configure this is better explained using an example.

Imagine you have a device, in which a given analog point (register address 100 for example) of type read/write must be read using function code 03, and must be write using function code 16.

To be able to read and write this Modbus point from BACnet, you must define two separate points into IntesisBox, one for read and one for write like the following:

<table>
<thead>
<tr>
<th>Nb</th>
<th>Dev</th>
<th>Modbus Code</th>
<th>Format</th>
<th>Add.</th>
<th>Bit</th>
<th>Frac</th>
<th>Bac.Name</th>
<th>Bac.Type</th>
<th>Bac.ID</th>
<th>Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>3-Read analog registers</td>
<td>4 - 16 bits sig C2</td>
<td>100</td>
<td>0</td>
<td></td>
<td>AI - example of Read Modbus point</td>
<td>0 - AI</td>
<td>0</td>
<td>1-Yes</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>16-Write multiple analog registers</td>
<td>4 - 16 bits sig C2</td>
<td>100</td>
<td>0</td>
<td></td>
<td>AO - example of Write Modbus point</td>
<td>1 - AO</td>
<td>0</td>
<td>1-Yes</td>
</tr>
</tbody>
</table>

The important configuration parameters to obtain the desired functionality are highlighted in green colour, the rest of configuration parameters are irrelevant in this example. Note that both points must have the same Modbus Address and the same Modbus Format.
5.1.4 Saving the configuration

When the configuration of the project is finished follow the next steps:

1. Click the button Save. Once accepted the pop-up message, that will save the project in the folder on hard disk (more information in LinkBoxBacnet Manual).

2. You will be prompted to generate the configuration file to be sent to the gateway,
   a. If YES is selected, the binary file (Modbus.LBOX) containing the configuration for the gateway will be generated and saved also into the project folder.
   b. If NO is selected the binary file needs to be created before following the next steps. To do so open the Configuration window (section 5.1) and restart from step 1

3. A pop-up message will show up asking if you want to preserve the Object instance numbers. BE CAREFUL using this feature.
   a. If NO is selected all the object instance numbers for the points will be automatically reconstructed and thus loosing previous instance numbers, if defined. ONLY USE this option for a brand new configuration not previously running in the gateway and therefore not yet integrated into the BACnet system
   b. Select Yes for configurations previously running in the gateway and already integrated into the BACnet system that had been extended with a few more points that must respect the previously defined object instance numbers. All the points with object instance numbers defined will be respected. LinkBoxBacnet will automatically assign object instance numbers to ones without it.

4. As the final step, a pop-up message will ask if you want to see the BACnet points list report. If you select Yes, a text file called Modbus- BACNET OBJECT LIST.TXT will be generated and saved into the project folder containing a report of all the point's BACnet information (for informative purposes at user level). The file will be also opened in the notepad, it looks like this:

<table>
<thead>
<tr>
<th>ObjIdent</th>
<th>ObjType</th>
<th>OInst</th>
<th>ObjName</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000000</td>
<td>0-AI</td>
<td>0000</td>
<td>AI_1_read</td>
</tr>
<tr>
<td>00000001</td>
<td>0-AI</td>
<td>0001</td>
<td>AI_2_read</td>
</tr>
<tr>
<td>04194304</td>
<td>1-AO</td>
<td>0000</td>
<td>AO_1_read_write</td>
</tr>
<tr>
<td>04194305</td>
<td>1-AO</td>
<td>0001</td>
<td>AO_2_read</td>
</tr>
<tr>
<td>04194306</td>
<td>1-AO</td>
<td>0002</td>
<td>AO_3_write</td>
</tr>
<tr>
<td>08388608</td>
<td>2-AV</td>
<td>0000</td>
<td>AV_1_read_write</td>
</tr>
<tr>
<td>08388609</td>

<td>BV_1_read_write</td>
</tr>
<tr>
<td>20971521</td>
<td>5-BV</td>
<td>0001</td>
<td>BV_2_read_write</td>
</tr>
</tbody>
</table>
5. Once in the configuration window again, click on exit. The configuration is ready to be sent to the IntesisBox (check LinkBoxBacnet Manual)

*The configuration cannot be received from the gateway to LinkBoxBacnet, it can only be sent.*
6. Mechanical & electrical characteristics

<table>
<thead>
<tr>
<th>Enclosure</th>
<th>Plastic, type PC (UL 94 V-0). Dimensions: 107mm x 105mm x 58mm.</th>
</tr>

</tr>
</tbody>
</table>

¹ Standard cable DB9male-DB9female 1,8 meters long is supplied with the device for connection to a PC COM port for configuring and monitoring the device. The configuration software, compatible with Windows® operating systems, is also supplied.
7. Dimensions

Free space recommended to install the device into a cabinet (wall or DIN rail mounting), with space enough for external connections:
