## 1 Description

### 1.1 Introduction

This document describes the integration of Mitsubishi Heavy Industries air conditioning systems into BACnet compatible devices and systems using the *MH-RC-BAC-1* gateway.

The aim of this integration is to monitor and control your Mitsubishi Heavy Industries air conditioning system, remotely, from your Control Center using any commercial SCADA or monitoring software that includes a BACnet driver, or connect it to other BACnet devices to do any automation. To do it so, IntesisBox allows BACnet communication allowing polling or subscription requests (COV).

IntesisBox makes available the Mitsubishi Heavy Industries air conditioning system indoor units through independent BACnet objects.

Abstraction of Mitsubishi Heavy Industries air conditioning system properties and functionalities as fixed BACnet Objects. IntesisBox allows fixed BACnet object IDs mapping. Simple configuration is needed: just select the appropriate communication parameters (MAC address, baud rate...).

This document assumes that the user is familiar with BACnet and Mitsubishi Heavy Industries technologies and their technical terms.

## 1.2 Functionality

IntesisBox continuously reads the Mitsubishi Heavy Industries AC system and keeps the updated status of all objects in its memory, ready to be served when requested from the BACnet side.

The role of IntesisBox consists in associate the elements of the Mitsubishi Heavy Industries AC system with BACnet objects.

The control of the indoor units through the MH-RC-BAC-1 is permitted, so commands towards the Mitsubishi Heavy Industries AC units are permitted too.

The indoor unit is offered in a set of BACnet objects and extra functionalities.

## 1.3 Capacity of IntesisBox

IntesisBox is capable of integrating one or more Mitsubishi Heavy Industries AC units and its associated elements.

Element	Max.	Notes
Number of indoor units	1*	Number of indoor units that can be controlled through IntesisBox
Number of Objects	32	Number of Mitsubishi Heavy Industries AC signals available as objects into IntesisBox.

\* NOTE: Keep in mind that more than one unit can be connected to the same MH-RC-BAC-1 gateway. You can control then more than one AC unit, but it will be actuated as a single unit. Different commands to different AC units connected to the same MH-RC-BAC-1 will not be allowed.

## 1.4 Quick Setup

1. Install IntesisBox in the desired installation site (DIN rail mounting inside a metallic industrial cabinet connected to ground is recommended).
2. Connect the communication cables. Details in section 5.3.29.
3. Connect to the IntesisBox. Details in section 7.5.
4. (Optional) Configure the IntesisBox using the configuration tool. Details in section 7.5.2.
5. Check the BACnet objects list for its integration to your BACnet project. Details in section 5.2.
6. Check if there is communication between BACnet and AC system. Details in section 7.5.3.
7. The IntesisBox is ready to be used in your system.

## 2 Protocol Implementation Conformance Statement

### BACnet Protocol Implementation Conformance Statement (PICS)

Date: 2014-12-05

Vendor Name: Intesis Software SL

Product Name: MH-RC-BAC-1

Product Model Number: MH-RC-BAC-1

Application Software Version: 1.0

Firmware Revision: 1.0.0.0

BACnet Protocol Revision: 12

#### Product Description:

Mitsubishi Heavy Industries air conditioning system – BACnet MS/TP & BACnet IP Gateway

Abstraction of Mitsubishi Heavy Industries air conditioning system properties and functionalities as BACnet Objects.

#### 2.1 BACnet Standardized Device Profile (Annex L):

- BACnet Operator Workstation (B-OWS)
- BACnet Building Controller (B-BC)
- BACnet Advanced Application Controller (B-AAC)
- BACnet Application Specific Controller (B-ASC)
- BACnet Smart Sensor (B-SS)
- BACnet Smart Actuator (B-SA)

Additional BACnet Interoperability Building Blocks Supported (Annex K):  
Reference of BIBBs List

#### 2.2 Segmentation Capability:

Segmented request supported  No  Yes Window Size 16 .  
Segmented responses supported  No  Yes Window Size 16 .

#### 2.3 Data Link Layer Options:

- BACnet IP, (Annex J)
- BACnet IP, (Annex J), Foreign Device
- ISO 8802-3, Ethernet (Clause 7)
- ANSI/ATA 878.1, 2.5 Mb. ARCNET (Clause 8)
- ANSI/ATA 878.1, RS-485 ARCNET (Clause 8), baud rate(s) \_\_\_\_\_
- MS/TP master (Clause 9), baud rate(s): 9600, 19200, 38400, 76800
- MS/TP slave (Clause 9), baud rate(s):
- Point-To-Point, EIA 232 (Clause 10), baud rate(s):
- Point-To-Point, modem, (Clause 10), baud rate(s):
- LonTalk, (Clause 11), medium: \_\_\_\_\_
- Other: \_\_\_\_\_

## 2.4 Device Address Binding:

Is static device binding supported? (This is currently necessary for two-way communication with MS/TP slaves and certain other devices.)  Yes  No

## 2.5 Networking Options:

- Router, Clause 6 - List all routing configurations, e.g., ARCNET-Ethernet, Ethernet-MS/TP, etc.
- Annex H, BACnet Tunneling Router over IP
- BACnet/IP Broadcast Management Device (BBMD)  
Does the BBMD support registrations by Foreign Devices?  Yes  No

## 2.6 Character Sets Supported

Indicating support for multiple character sets does not imply that they can all be supported simultaneously.

- ANSI X3.4
- IBM™/Microsoft™ DBCS
- JIS C 6226
- ISO 10646 (UCS-4)
- ISO 10646 (UCS-2)
- ISO 8859-1

## 2.7 Gateway

If this product is a communication gateway, describe the types of non-BACnet equipment/network(s) that the gateway supports:

**Mitsubishi Heavy Industries Air Conditioning with RAC Series, FD Series, KX6 and KXR6 (VRF) Series air conditioners commercialized by Mitsubishi Heavy Industries.**

### 3 BACnet Interoperability Building Blocks Supported (BIBBs)

#### 3.1 Data Sharing BIBBs

## 5.3 Objects and properties

Below you can find relevant information for the objects and properties.

**Object\_Identifier:** In the **Device Object**, is configurable writing directly on the property. either from BACnet or through our configuration tools and can be set automatically or manually. When set automatically, it is set using a base address and the address selected in SW2 P1..P7. The base address can be selected using the configuration tool. When set manually, the address is directly the one configured on the configuration tool. See section 7.4 for more information

**Object\_Name:** In the **Device Object**, is configurable writing directly on this property. This can be done using the configuration tools too. See section 7.5 for more information.

**Description:** In the **Device Object**, is configurable writing directly on the property, length maximum 63 chars. This string is configurable using the configuration tool. See section 7.5 for more information.

## 6 Connections and switches

### 6.1 Connect to the Remote Controller bus

Disconnect the Mitsubishi Heavy Industries system from Mains Power

Connect the interface to XY bus in any point of the bus. The XY bus is the bus that connects the AC indoor unit and the wired remote controller, is a two-wire bus connecting terminals XY of both. This XY connection has no specific polarity.

**Connection diagram**

If a Mitsubishi Heavy Industries remote controller (RC) is present and connected to the XY bus, there are two configuration options:

- If we want to use the RC as master, its PCB switch must be set as Master and the MH-RC-BAC-1 must be configured as Slave.
- If we want to use the RC as slave, its PCB switch must be set as Slave and the MH-RC-BAC-1 must be configured as Master.

#### SW4 – Master/Slave settings

Binary value b <sub>1</sub> ...b <sub>0</sub>	Decimal value	Switches 1 2	Description
0x	0	↓ x	Slave in P1P2 bus (default value)
1x	1	↑ x	Master in P1P2 bus

Please, check the configuration for the AC unit to ensure proper control of the AC unit according to its specifications. Use **SW3** for the Celsius/Fahrenheit degrees selection and **SW4** for the Reference Temperature (Room temperature) to be used. More information about it can be found on section **Error! No se encuentra el origen de la referencia..**

#### SW3 - Celsius/Fahrenheit selection

Binary value b <sub>7</sub> ...b <sub>0</sub>	Decimal value	Switches 1 2 3 4 5 6 7 8	Description
xxxx0xxx	0	x x x x ↓ x x x	Celsius degrees (default value)
xxxx1xxx	1	x x x x ↑ x x x	Fahrenheit degrees

**⚠ Important:** Remember that switch changes only apply after an IntesisBox power cycle

## 6.2 Connect to BACnet MS/TP

Connect the EIA485 bus wires to the plug-in terminal block (EIA485) of MH-RC-BAC-1; respect the polarity on this connection (A+ and B-).

Connect the ground signal to the plug-in terminal block (SG).

Respect the maximum distance of 1.200 meters for the bus, no loop or star topologies are allowed for EIA485 bus.

Remember that a terminator resistor of  $120\ \Omega$  must be present at each end of the bus to avoid signal reflections and also a polarization mechanism. Please, use switch **SW1** in order to configure these parameters.

Binary value $b_2\dots b_0$	Decimal value	Switches 1 2 3	Description
0xx	0	↓ x x	EIA485 bus without termination resistor. The gateway is not at one end of the EIA485 bus (default value)
1xx	1	↑ x x	120 $\Omega$ termination resistor active. The gateway is at one end of the EIA485 bus
x00	0	x↓↓	No bus polarization
x11	3	x↑↑	Bus polarization active

Please, check as well configuration on **SW2** and **SW3** before connecting to BACnet MS/TP.

### 6.2.1 MS/TP MAC address switch configuration

MAC address can be configured using **SW2** DIP-Switch

Binary value $b_7\dots b_0$	Decimal value	Switches 1 2 3 4 5 6 7 8	MAC address
0000000x	0	↓ ↓ ↓ ↓ ↓ ↓ ↓ x	0
1000000x	1	↑ ↓ ↓ ↓ ↓ ↓ ↓ x	1
0100000x	2	↓ ↑ ↓ ↓ ↓ ↓ ↓ x	2
1100000x	3	↑ ↑ ↓ ↓ ↓ ↓ ↓ x	3
....	....	....	...
1011111x	125	↑ ↓ ↑ ↑ ↑ ↑ ↑ x	125
0111111x	126	↓ ↑ ↑ ↑ ↑ ↑ ↑ x	126
1111111x	127	↑ ↑ ↑ ↑ ↑ ↑ ↑ x	127

The MAC address selected my affect on the Device Instance. If the “Auto Device Instance” is used, keep in mind that the Device Instance will be build using the “Device Instance Base” + the address selected in SWP2 P1-P7. Please, check section 7.5 for more information.

### 6.2.2 MS/TP activation and baudrate

Select the right baudrate for BACnet MS/TP communication using switch **SW3**.

Binary value $b_7\dots b_0$	Decimal value	Switches 1 2 3 4 5 6 7 8	Description
0xxxxxxx	0	↓ x x x x x x x	BACnet MS/TP active (default value)
1xxxxxxx	1	↑ x x x x x x x	BACnet IP active
x000xxxx	0	x↓↓↓x x x x	Autobaudrate (default value) *
x100xxxx	1	x↑↓↓x x x x	9600 bps
x010xxxx	2	x↓↑↓x x x x	192000 bps
x110xxxx	3	x↑↑↓x x x x	38400 bps
x001xxxx	4	x↓↓↑x x x x	57600 bps
x101xxxx	5	x↑↓↑x x x x	76800 bps
x011xxxx	6	x↓↑↑x x x x	115200 bps
x111xxxx	7	x↑↑↑x x x x	Autobaudrate *
xxxx0xxx	0	x x x x ↓ x x x	Celsius degrees (default value)
xxxx1xxx	1	x x x x ↑ x x x	Fahrenheit degrees

**⚠ Important:** Remember that switch changes only apply after an IntesisBox power cycle

\* Note: If Autobaudrate is selected, the MH-RC-BAC-1 will look for another BACnet MS/TP device with a fixed baudrate in order to match this value. Once detected, the baudrate will not be modified until a device reset is produced.

## 6.3 Connect to BACnet IP

Connect the RJ45 connector to the Ethernet connection (ETH) of MH-RC-BAC-1.

Respect same recommendations as per any other Ethernet communication network.

Remember to activate the IP interface through the **SW3** switch.

Binary value b <sub>7</sub> ...b <sub>0</sub>	Decimal value	Switches 1 2 3 4 5 6 7 8	Description
0xxxxxxx	0	↓ x x x x x x x	BACnet MS/TP active (default value)
1xxxxxxx	1	↑ x x x x x x x	BACnet IP active

By default, the MH-RC-BAC-1 comes with a static IP address: **192.168.100.246**.

In order to change it, please use the configuration tool and select either DHCP or another static IP (recommended) that suits your integration project requirements. Check section 7.5 for more information.

### 6.3.1 BACnet Device Instance

If the “Auto Device Instance” is used, keep in mind that the Device Instance will be build using the “Device Instance Base” + the address selected in SWP2 P1-P7.

Binary value b <sub>7</sub> ...b <sub>0</sub>	Decimal value	Switches 1 2 3 4 5 6 7 8	MAC address
0000000x	0	↓ ↓ ↓ ↓ ↓ ↓ x	0
1000000x	1	↑ ↓ ↓ ↓ ↓ ↓ x	1
0100000x	2	↓ ↑ ↓ ↓ ↓ ↓ x	2
1100000x	3	↑ ↑ ↓ ↓ ↓ ↓ x	3
....	....	....	...
1011111x	125	↑ ↓ ↑ ↑ ↑ ↑ x	125
0111111x	126	↓ ↑ ↑ ↑ ↑ ↑ x	126
1111111x	127	↑ ↑ ↑ ↑ ↑ ↑ x	127

**⚠ Important:** Remember that switch changes only apply after an IntesisBox power cycle

## 7 Set-up process and troubleshooting

### 7.1 Pre-requisites

In a BACnet MS/TP integration, it is necessary to have the BACnet MS/TP Master device operative and well connected to the BACnet MS/TP port of the MH-RC-BAC-1.

In a BACnet IP integration, it is necessary to have the BACnet IP client operative and well connected to the IP network and the MH-RC-BAC-1 connected to this same IP network through the ETH port.

Items supplied by Intesis Software for this integration are:

- IntesisBox MH-RC-BAC-1 interface with Mitsubishi Heavy Industries AC external protocol firmware loaded.
- Specific connection cable to connect Mitsubishi Heavy Industries AC unit with MH-RC-BAC-1 gateway.
- MiniUSB cable for console communication and testing power supply usage.
- Product documentation.

### 7.2 Physical checking

First point to look at to make sure that gateway is working properly is to check physical connections:

- 1.- Make sure that the supplied cable is correctly connected between the AC unit and the gateway. MH-RC-BAC-1 needs to be connected to the AC unit or externally powered before start the device configuration. USB port can be used, along with an external USB power converter, to power the device for testing purposes if the AC unit is not present.
- 2.- Check that the AC unit is connected to mains.
- 3.- If using BACnet MS/TP, check the EIA485 connection from the gateway to the BACnet MS/TP. Remember to verify polarity and terminal resistors configuration. If using BACnet IP, check the IP network connections.

### 7.3 LED status

On start up, all leds blink once and then turn off. After that, depending on the type of connection (MS/TP or IP) and the processes carried out, LED status may change.

Please, check the table below for more information:

LED	Status	Description
L1 (red)	ON Steady	AC communication error
	Blinking	AC error
	Off	No errors present
L5 (green)	ON Steady	BACnet MS/TP link
	Blinking	Activity on the BACnet MS/TP bus
L6 (green)	ON Steady	Ethernet link
	Blinking	Activity on BACnet IP
L1+L4+L5	Blinking	Device in Bootloader mode
All	Blinking	Fatal Error
All	On Steady 1 sec	On start up (for testing purposes)

## 7.4 Occupancy

Occupancy function is used to determine how the Air Conditioner unit will be set depending on the presence or absence of people in the room. Remember that the occupancy signal needs to be fed by an external sensor which indicates if there is presence or not (occupancy). This signal is processed directly in the IntesisBox and modifies 3 parameters from the AC system: Setpoint, Mode and On/Off.

In order to adjust the settings to the current mode (Heat or Cool), the gateway offers 6 different BACnet objects:

- OccupiedCoolSetPoint
- OccupiedHeatSetPoint
- UnoccupiedCoolSetPoint
- UnoccupiedHeatSetPoint
- OccupancyContinousCheck
- UnoccupiedDeadbandAction

**Occupancy/Unoccupancy Cool Setpoint (OCS/UCS):** Default value for setpoint temperature to be set when Occupancy/Unoccupancy is enabled and current mode is cool. UCS must always be greater or equal to OCS. Difference between OCS and OHS must be greater or equal to 2°C/4°F.

**Occupancy/Unoccupancy Heat Setpoint (OHS/UHS):** Default value for setpoint temperature to be set when Occupancy/Unoccupancy is enabled and current mode is heat. UHS must always be smaller or equal to OHS. Difference between OCS and OHS must be greater or equal to 2°C/4°F.

**Occupancy Continous check:** This checkbox is used to determine if the gateway will check the occupancy conditions constantly (check) or not (unchecked) by default. That means that with the checkbox active, conditions are checked on each change of the temperature too, while if unchecked, this is only checked when the occupancy status changes.

**Unoccupied Deadband Action:** This determines the action to be taken while the ambient temperature is in between the deadband. If unchecked, indoor unit will turn off and if checked it will remain on.

When **occupancy mode is active** (there is presence in the room), according to current room temperature, **mode**, **setpoint** and **on/off** will be set to:

Condition	Setpoint	Mode	On/Off
Room temperature > OCS	Current OCS value	Cool	On
Room temperature < OHS	Current OHS value	Heat	On
OCS < Room temperature > OHS	OCS/OHS depending on current mode (If Fan or Dry mode is active, no setpoint is sent)	Current mode	On

When **unoccupancy mode is active** (there is no presence in the room), according to current room temperature, **mode**, **setpoint** and **on/off** will be set to:

Condition	Setpoint	Mode	On/Off
Room temperature > OCS	Current UCS value	Cool	On
Room temperature < OHS	Current UHS value	Heat	On
OCS < Room temperature > OHS	UCS/UHS depending on current mode (If Fan or Dry mode is active, no setpoint is sent)	Current mode	On (Deadband action =1)
			Off (Deadband action =0)

These checks will be done each time the indoor unit occupancy status is changed, and if **check continuously** checkbox is checked, also each time the room temperature changes.

The configuration set on the occupant signals is applied from the very first moment the occupancy signal is enabled until the user changes the setpoint, mode or the On/Off signal, which disables occupancy functionality.

## 7.5 Configuration tool

In order to check the status of the device, signals values and general configuration, the MH-RC-BAC-1 includes a configuration tool. This tool is accessible only through the Ethernet port, so keep in mind that you need to switch **SW3 P1 'ON'**.

By default the device comes with a static IP, so please check that you are in the same network domain in order to connect. The default IP is: **192.168.100.246**.

### 7.5.1 Home

Once you reach the page, remember to login with your user and password. To access the login site, click on "User" or use the drop-down menu on the top right corner for user selection.

There are two access levels: **admin** and **operator**. The default password value for each user is **admin** → admin and **operator** → operator.

Admin has total control on the device configuration and it can control the AC unit from the web app itself. On the contrary, operator can only read information from the current configuration and can operate the AC. Priority used when using the operator mode is always set to 8.

**IMPORTANT:** Once configuration is done, we recommend changing the passwords to ensure access control on the gateway.

## 7.5.2 Configuration

On the configuration section, general **BACnet settings**, specific **BACnet MS/TP** and **BACnetIP settings**, **IP settings** and **AC settings** can be configured. Each type of parameter is grouped in different blocks.

## 7.5.3 Signals

On this section a complete list of the available BACnet objects, their **type**, **Object Instance**, **priority** and current **value** is shown. Clinking on the “**Edit**” button, users will be able to command the system having feedback from both BACnet and AC system.

It also allows continuous monitoring of the current status of the variables. The refresh time for the AC information is shown using a progression bar in the top and the bottom of the signals list.

0	01	N/A	No active error
-1	02	Com Err.	Comm Error between MH-RC-BAC-1 and MHI Indoor Unit
1	03	E1	Remote controller communication error
2	04	E2	Duplicated indoor unit address
3	05	E3	Outdoor unit signal line error
5	07	E5	Communication error during operation
6	08	E6	Indoor heat exchanger temperature thermistor anomaly
7	09	E7	Indoor return air temperature thermistor anomaly
8	10	E8	Heating overload operation
9	11	E9	Drain trouble
10	12	E10	Excessive number of indoor units (more than 17) by controlling one remote controller
12	14	E12	Address setting error by mixed setting method
14	16	E14	Communication error between master and slave indoor units
16	18	E16	Indoor fan motor anomaly
19	21	E19	Indoor unit operation check, drain motor check setting error
28	30	E28	Remote controller temperature thermistor anomaly
30	32	E30	Unmatched connection of indoor and outdoor unit
31	33	E31	Duplicated outdoor unit address No.
32	34	E32	Open L3 Phase on power supply at primary side
33	35	E33	Inverter primary current error
35	37	E35	Cooling overload operation
36	38	E36	Discharge pipe temperature error
37	39	E37	Outdoor heat exchanger temperature thermistor anomaly
38	40	E38	Outdoor/Ambient air temperature thermistor anomaly
39	41	E39	Discharge pipe temperature thermistor anomaly
40	42	E40	High pressure error
41	43	E41	Power transistor overheat
42	44	E42	Current cut
43	45	E43	Excessive number of indoor units connected, excessive total capacity of connection
45	47	E45	Communication error between inverter PCB and outdoor control PCB
46	48	E46	Mixed address setting methods coexistent in same network
47	49	E47	Inverter over-current error
48	50	E48	Outdoor DC fan motor anomaly
49	51	E49	Low pressure anomaly
51	53	E51	Inverter anomaly

53	55	E53	Suction pipe temperature thermistor anomaly
54	56	E54	High/Low pressure sensor anomaly
55	57	E55	Underneath temperature thermistor anomaly
56	58	E56	Power transistor temperature thermistor anomaly
57	59	E57	Insufficient refrigerant amount or detection of service valve closure
58	60	E58	Anomalous compressor by loss of synchronism
59	61	E59	Compressor startup failure
60	62	E60	Rotor position detection failure / Anomalous compressor rotor lock
61	63	E61	Communication error between the master unit and slave units
63	65	E63	Emergency stop
