1 EKM Metering V3 V4 Driver Description

This serial driver connects to a trunk of 1 or more (v3 and v4) EKM Meters using RS485. It is capable of reading operational and status data from each meter.

The driver is capable of being linked with other FieldServer drivers to form regular FieldServer firmware that can be installed on QuickServer and other FieldServer gateways. Other drivers can access the EKM Meter data and serve using other protocols such as BACnet and Modbus .

The driver is an active client driver in that it poll's for data – reading or writing data from meters. It cannot be used to simulate and EKM meter. Because only the client side of the protocol is implemented.

The driver is fully compatible with other FieldServer drivers and meets FieldServer's quality assurance standards. The driver was developed by Chipkin Automation Systems, an Approved FieldServer Integrator.

Max Nodes Supported

| FIELDSEVER MODE | NODES | COMMENTS |
|-----------------|-------|--|
| Client | Many | Number of Meters is determined by vendor and RS485 limitations. Trunks of dozens of devices supported. |
| Server | 0 | Not supported or documented. |

2 Driver Scope of Supply

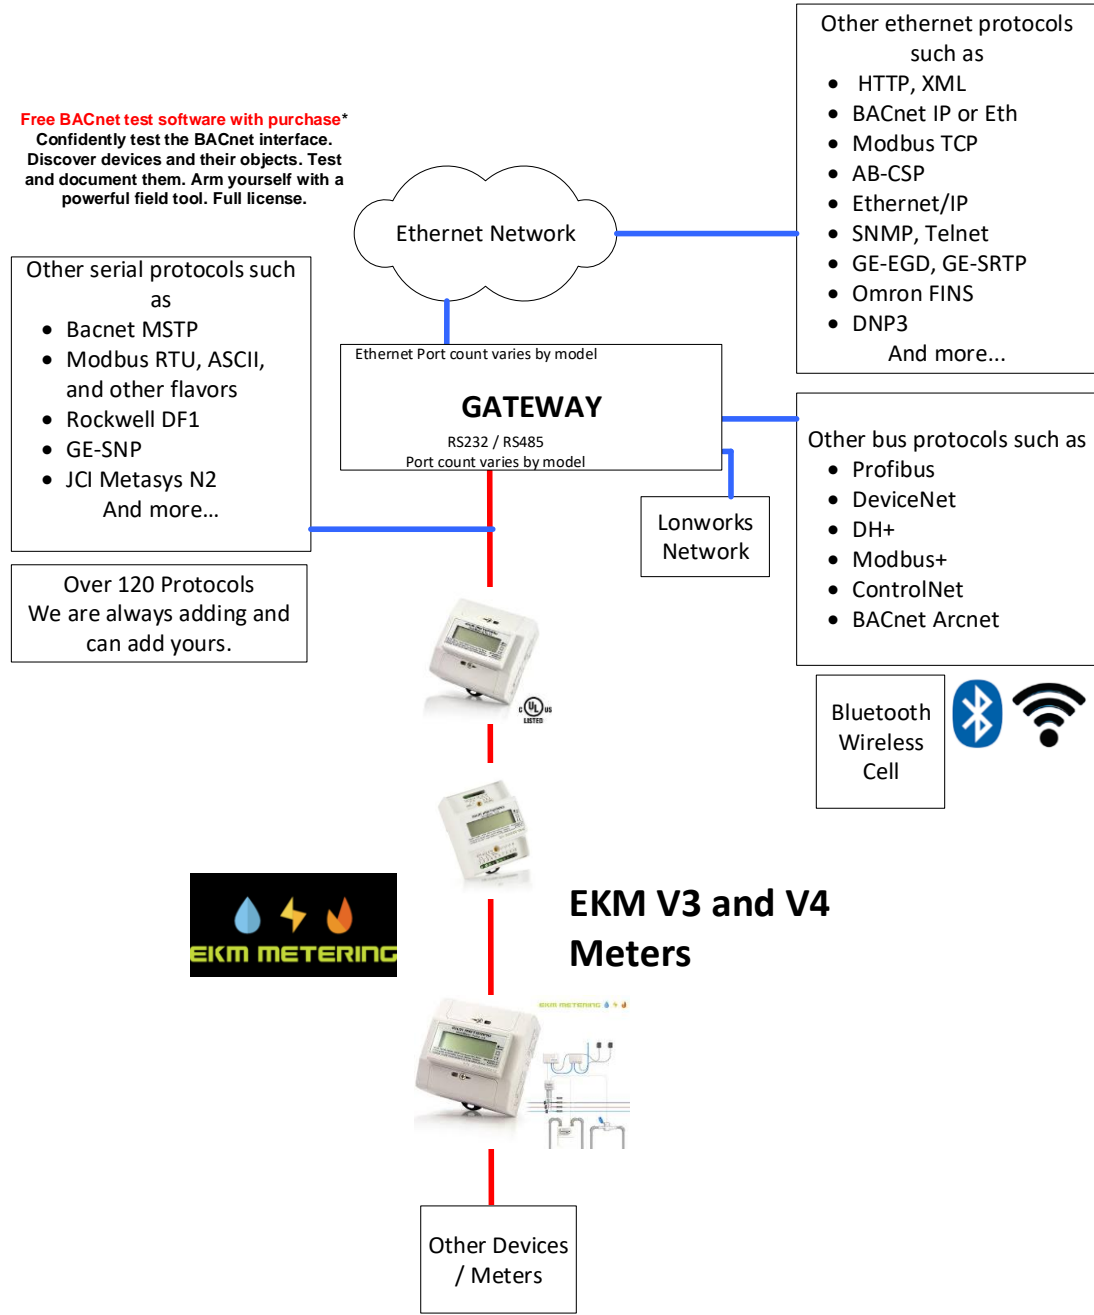

2.1 Supplied with this driver

| FIELDSEVER TECHNOLOGIES PART # | DESCRIPTION |
|--------------------------------------|--|
| Cables | No specific cables are shipped with this driver. |
| FS-8705-36 | Driver Manual. |
| | |
| | |
| | |

3 Hardware Connections

3.1 Block Diagram

Multiple WorkStation protocols and connection supported. See list of FieldServer Drivers

3.2 Cable Connections

3.2.1 FS-1010 and FS-1210 Connections

There are 2x RS485 Ports.

R1 – Top of Unit

R2 = Bottom of Unit (This connection will only be used if you are connecting to 2 separate RS485 trunks)

2 Wire RS485 – often requires the 3rd wire – the signal common wire. We suggest providing a conductor for this purpose but in most cases it will not be required.

Port R1 - RS485

Port R2 - RS485

3.2.2 FS-1020 and FS-1220 Connections

There are 1x RS485 Ports identified as R1. See FS-1010 Connection info above for connection info.

R1 – Top of Unit

3.2.3 FSB-3510 Connections

FSB-3510 RS485
Connections R1 & R2

3.2.4 Meter Connections

4 Configuring the FieldServer as a EKM Metering V3 V4 Client

For a detailed discussion on FieldServer configuration, please refer to the FieldServer Configuration Manual. The information that follows describes how to expand upon the factory defaults provided in the configuration files included with the FieldServer (See “.csv” sample files provided with the FS).

This section documents and describes the parameters necessary for configuring the FieldServer to communicate with an EKM Metering V3 V4 system.

The configuration file tells the FieldServer about its interfaces, and the routing of data required. In order to enable the FieldServer for EKM Metering V3 V4 monitoring, the driver independent FieldServer buffers need to be declared in the “Data Arrays” section, the destination device addresses need to be declared in the “Client Side Nodes” section, and the data required from the servers needs to be mapped in the “Client Side Map Descriptors” section. Details on how to do this can be found below.

Note that in the tables, * indicates an optional parameter, with the bold legal value being the default.

4.1 Data Arrays

| SECTION TITLE | | |
|-------------------|--|--|
| Data_Arrays | | |
| COLUMN TITLE | FUNCTION | LEGAL VALUES |
| Data_Array_Name | Provide name for Data Array | Up to 15 alphanumeric characters |
| Data_Array_Format | Provide data format. Each Data Array can only take on one format. | Recommended: Bit, UInt16, Also Supported: Float, UInt32, SInt16, Packed_Bit, Byte, Packed_Byte, Swapped_Byte |
| Data_Array_Length | Number of Data Objects. Must be larger than the data storage area required by the Map Descriptors for the data being placed in this array. | 1-10,000 |

4.1.1 Data Arrays - Example

```
// Data Arrays
Data_Arrays
Data_Array_Name,          Data_Format,          Data_Array_Length,
EKM-Stats,                UNT16,                200
000000028801,            FLOAT,                200
```

4.2 Client Side Connections

Create one connection for each EKM Metering V3 V4 serial port. Each connection can only be used to connect to a single EKM Metering V3 V4 interface/port.

| SECTION TITLE | | |
|---------------|---|--|
| Connections | | |
| COLUMN TITLE | FUNCTION | LEGAL VALUES |
| Port | Specify which port the device is connected to the FieldServer | P1-P8 |
| Protocol | Specify protocol used | EKM |
| Baud* | Specify baud rate | Driver Supports : 110; 300; 600; 1200; 2400; 4800; 9600 ; 19200; 28800; 38400; 57600 Baud EKM Default = 9600 |
| Data_Bits * | Specify parity | Driver Supports : 7,8 EKM Default = 7 |
| Stop_Bits* | Specify data bits | Driver Supports : 1,2 EKM Default = 1 |
| Parity * | Specify stop bits | Driver Supports : Odd, Even, None EKM Default = Even |
| | | |

4.2.1 Client Side Connection Descriptions - Example

| | | | | |
|----------------------------|------|---------|------------|-----------|
| // Client Side Connections | | | | |
| Connections | | | | |
| Port, | Baud | Parity, | Data_Bits, | Stop_Bits |
| R1, | 9600 | Even, | 7, | 1, |

4.3 Client Side Nodes

Create one Node per FACP in the network only.

| SECTION TITLE | | |
|---------------|---------------------------------|--|
| Nodes | | |
| COLUMN TITLE | FUNCTION | LEGAL VALUES |
| Node_Name | Provide name for node | Up 12 of the max of 32 alphanumeric characters possible to specify the Node name. NB ! The name must be set to the Meter's 12 character address. |
| Node_ID | Not used directly by the driver | 0-255 Commonly omitted. If you are using Node_Status bits then allocate a Node_ID. Give each meter a unique number. |
| Protocol | Specify protocol used | EKM |

4.3.1 Client Side Nodes – Example

```
// Client Side Nodes

Nodes
Node_Name,           Node_ID,           Protocol,           Connection
000000028016,       0,                EKM,                R1
```

4.4 Client Side Map Descriptors

4.4.1 FieldServer Related Map Descriptor Parameters

| COLUMN TITLE | FUNCTION | LEGAL VALUES |
|---------------------|--|---|
| Map_Descriptor_Name | Name of this Map Descriptor | Up to 32 alphanumeric characters |
| Data_Array_Name | Name of Data Array where data is to be stored in the FieldServer | One of the Data Array names from "Data Array" section above |
| Data_Array_Offset | Starting location in Data Array | 0 to maximum specified in "Data Array" section above |
| Function | Function of Client Map Descriptor.. | Rdbc,wrbc,wrbc |

4.4.2 Driver Related Map Descriptor Parameters

| COLUMN TITLE | FUNCTION | LEGAL VALUES |
|--------------|---|---|
| Node_Name | Name of Node to fetch data from | One of the node names specified in "Client Node Descriptor" above |
| Data_Type | This commonly used parameter is not used by this driver. | |
| Length | Length of Map Descriptor Reserves space in the Data Array. | V3 Read Length=36 V4 Read Length = 45 V4 ReadB Length = 27 6 Month Data Length = 30 Set the value to 1 when using services that write to the meters. Explanation is provided in section which describes the services. |
| Address | The Relay Number | 1,2 |

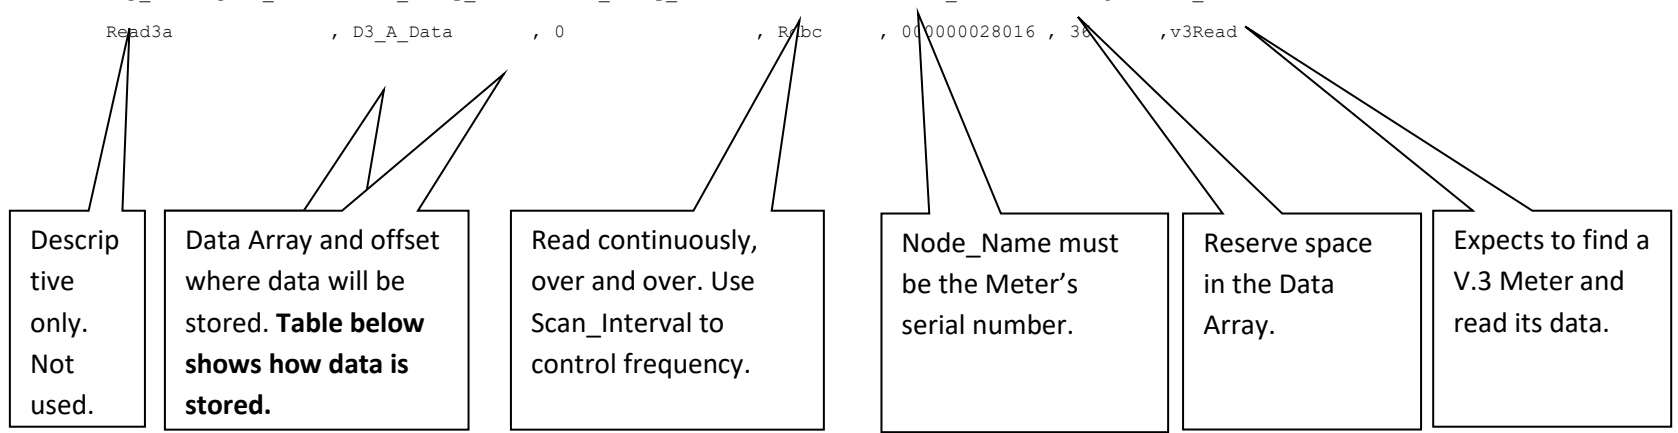

| | | |
|--|--|---|
| | | Only required on Map Descriptors which use the service which operates the relays. |
| | | |
| | | |
| | | |

4.5 Examples

4.5.1 Map Descriptor Example 1 – Read V.3 Meter

This is the only function available to read energy data from a V3 Meter

```

| Month_6_Tariff_3 | kWh_Scale | 28 |
| Month_6_Tariff_4 | kWh_Scale | 29 |

4.5.5 Map Descriptor Example 5 – Control V.4 Relays

Turn Relay 1 or 2 On/Off and optionally set the duration. The Address param tells the driver which relay you want to act on. Two data items are sent with the message. At offset=0 set the required state (zero or 1). At offset=1 set the duration in seconds. Zero means latch. Max seconds are 9999. The wrbx (write on update) action is triggered when the data in offset zero is updated. The wrbx action is not triggered when you set the value at offset=1 – the reason is that the Map Descriptor length is set to 1. For these tasks to execute to completion, the meter must have a password of '00000000'. If the meter password is different then the password must be setup in the configuration file. (See Appendix) .

```
Map_Descriptors
Map_Descriptor_Name , Address ,Data_Array_Name , Data_Array_Offset , Function , Node_Name , Length ,EKM_Function
Control Relay 1 , 1 ,D4_RELAY1 , 0 , wrbx , 000000028016 , 1 , v4SetRelay
Control Relay 2 , 2 ,D4_RELAY2 , 0 , wrbx , 000000028016 , 1 , v4SetRelay
```

4.5.6 Map Descriptor Example 6 – Set CT Ratio

This task extracts the new CT ratio from offset=0 of the data array and sends it to the Meter. Works with V3 or V4 Meters. The meter must have a password of '00000000'. If the meter password is different then the password must be setup in the configuration file. (See Appendix).

```

Map_Descriptors
Map_Descriptor_Name ,Data_Array_Name , Data_Array_Offset , Function , Node_Name , Length ,EKM_Function
Set CT Ratio ,DA_CT_Ratio , 0 , wrb , 000000028016 , 1 , v3v4SetCTRatio
    
```

Descriptive only. Not used.

Data Array and offset where data will be stored. New

Write on update. This task is triggered when the data in the array is updated.

Node_Name must be the Meter's serial number.

Reserve space in the Data Array.

Expects to find a V.4 Meter. Will set the relay. This action requires that the password is setup.

4.5.7 Map Descriptor Example 7 – Reset

Trigger this action by updating the value in the Data Array offset=0. The value is not sent to the Meter but is only used as a trigger. Works with V4 Meters. The meter must have a password of '00000000'. If the meter password is different then the password must be setup in the configuration file. (See Appendix).

```
Map_Descriptors
Map_Descriptor_Name ,Data_Array_Name , Data_Array_Offset , Function , Node_Name , Length ,EKM_Function
Set CT Ratio ,DA_RESET , 0 , wrb , 000000028016 , 1 , v4Reset
```

Descriptive only. Not used.

Data Array and offset where data will be stored. New

Write on update. This task is triggered when the data in the array is updated.

Node_Name must be the Meter's serial number.

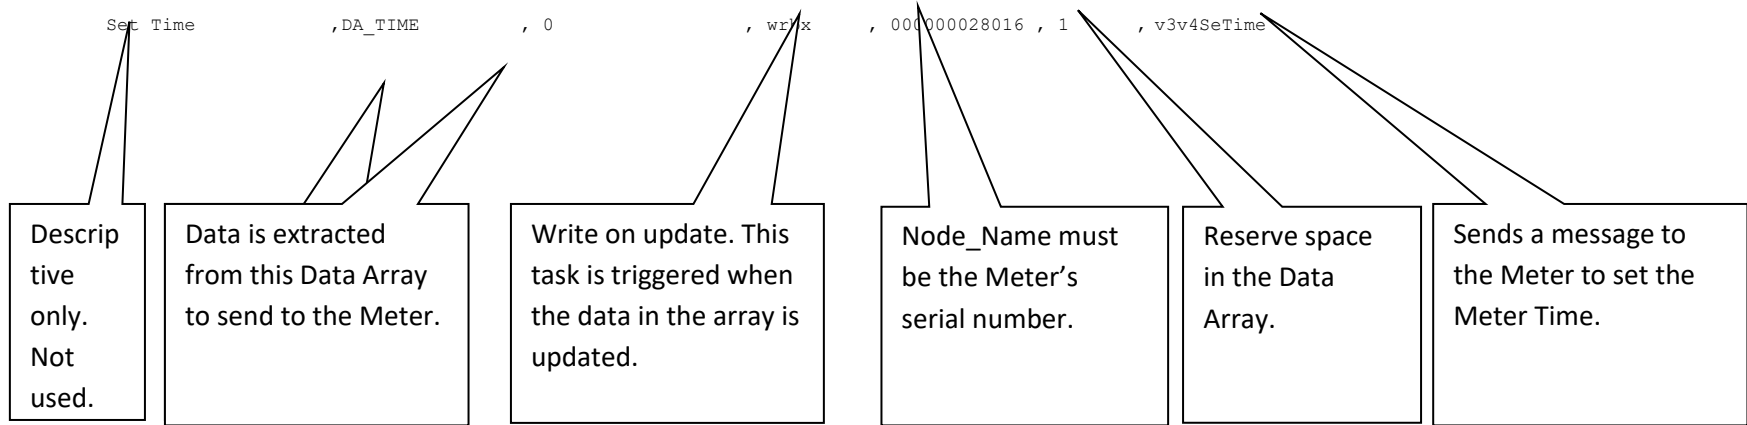

Reserve space in the Data Array.

Expects to find a V.4 Meter. Will set the relay. This action requires that the password is setup.

4.5.8 Map Descriptor Example 8 – Set Time

Trigger this action by updating the value in the Data Array offset=0. The value is not sent to the Meter but is only used as a trigger. When triggered, the driver extracts values from the Data array to send to the Meter to set the time. Preload offsets 1..7 then set the trigger.

```
Map_Descriptors
Map_Descriptor_Name ,Data_Array_Name , Data_Array_Offset , Function , Node_Name , Length ,EKM_Function
Set Time , DA_TIME , 0 , wr/x , 000000028016 , 1 , v3v4SetTime
```

| Trigger | Data_Array | Offset= |
|--------------|------------|----------|
| year | Data_Array | Offset=1 |
| month | Data_Array | Offset=2 |
| day of month | Data_Array | Offset=3 |
| day of week | Data_Array | Offset=4 |
| hour | Data_Array | Offset=5 |
| minute | Data_Array | Offset=6 |
| second | Data_Array | Offset=7 |

5 Configuring the FieldServer as a EKM Metering V3 V4 Server

This driver cannot be used to emulate an EKM Meter. If you want to use another energy meter and you want it to appear like an EKM meter then you would need this emulation. Ask our sales department if you need this functionality.

Appendix A. Advanced Topics

This section is blank.

Appendix A.1 Notes on Operation of the Driver

In the configuration of a gateway, normally a single map descriptor represents a single task - for example read some data and store the data extracted from the response in the Data Array associated with the Map Descriptor.

This driver operates slightly differently. For example to read the 6 Month Data, one has to perform a Read of Data Set A prior. When one wants to send a command like the time or a reset, then the driver actually has to execute 3 tasks – Read Data Set A, Send the password and then finally send the command.

A consequence of this is that the Data Set A is read more often than necessary and in some cases its payload is discarded because the Data Array associated with the Map Descriptor is not intended for storing the Data Set A data.

Each time a response from the Meter contains data, the Data Array named with the Meter Number will also be updated. This data array will always have the most complete and up to date information. Read the section on Additional Data Storage method.

Appendix A.2 Additional Storage Method

If you create a Data Array whose name is identical to the Node_Name (The Meter Serial number) then when a read task is executed, besides storing the data in the Map Descriptor's Data array, the driver will additionally store data in the array named after the Meter.

Eg.

Data_Arrays

Data_Array_Name ,Data_Format ,Data_Array_Length

000350002401 ,FLOAT ,200

000000028016 ,FLOAT ,200

Appendix A.3 Supported Communications functions

Always check the Data Sheet for an accurate and up to date list.

| PROTOCOL SERVICE | SUPPORTED |
|------------------------------|-----------|
| V3 Read Meter Data/Connect | Yes |
| V4 Read Meter Data A/Connect | Yes |
| V4 Read Meter Data B | Yes |

| | |
|--|----------------|
| V4 Set Relay | Yes |
| V4 Set Pulse Input Ratio | No. See Note 1 |
| V4 Set Pulse Output Ratio | No. See Note 1 |
| V4 Reset Resettable kWh Reverse | Yes |
| V4 Auto Reset Max Demand | No. See Note 1 |
| V4 Set LCD | No. |
| v3/v4 Send Password | Yes |
| v3/v4 Change Password | No. See Note 1 |
| v3/v4 Set Max Demand Period | No. See Note 1 |
| v3/v4 Set Max Demand Reset Value | No. See Note 1 |
| v3/v4 Set Time | Yes |
| v3/v4 Set CT Ratio | Yes |
| v3/v4 Set Schedule Tariffs | No. See Note 1 |
| v3/v4 Read Schedule Tariffs | No. See Note 1 |
| v3/v4 Set Seasons | No. See Note 1 |
| v3/v4 Set Holidays | No. See Note 1 |
| v3/v4 Read Holiday Dates | No. See Note 1 |
| v3/v4 Set Schedule for Weekend and Holiday | No. See Note 1 |
| v3/v4 Read 6 Months | Yes |

Note 1 : These are configuration services. The data does not change during normal operation once installation and setup has been completed

If you require these services for as project please contact our sales department to get special firmware.

Appendix A.4 Password Protected Meters

Support for max 6 digit password. Use the 'Route' parameter on the node as illustrated in the example below. If not specified as password of zero's is assumed.

Nodes

Node_Name , Node_ID , Protocol , Port ,Route

000350002401 , 1 , EKM , R1 ,1.2.3.4.5.6

Appendix A.5 Auto / Simplified Configuration

This driver supports a simplified configuration method. It is intended to simplify the configuration by requiring that you specify the minimum amount of data required. A sample ini file is show below.

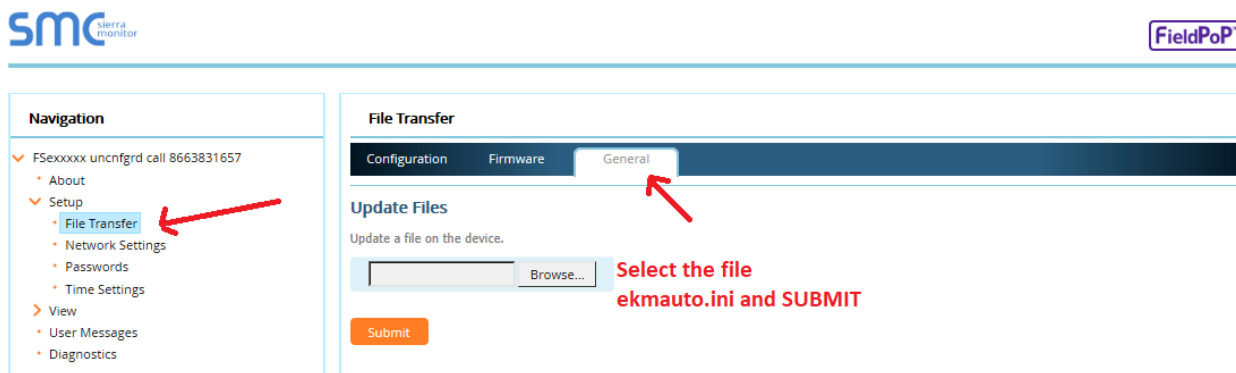

Auto config will generate one ModbusTCP and one BACnetIPnode for each meter. Under each node will be a set of (server) data objects that remote systems can read (and write). Each node will have identical objects numbered the same way. The objects for a V3 or V4 meter are different.

1. STEP 0 - Load basic Driver config file (Shipped with this file already loaded)
2. **STEP 1 - Prepare** and send file ekmauto.ini to gateway

Watch the Youtube video on how to do this.

Structure and contents of file are explained in more detail on following pages.

(Browse to gateway, From the menu: SETUP, File Transfer, General, Select the file ekmauto.ini, send to device).

3. **Step 2** - Trigger the Autoconfig.

Trigger AutoConfig by Browsing to the data array called "EKM_autoConfig" and poking the value 99 into offset 0. At that time the driver will generate a new config.csv and reboot itself. Do not power down during this process.

(Browse to device, From the Menu: VIEW, Arrays, View the Array called "EKM_AutoConfig", Enable Edits – button near bottom center of screen, Poke the value 99 into offset 0 - Youtube video shows this)

A few seconds later the device will restart and start polling the meters.

You could then use the CAS BACnet Explorer to do discovery.
